

# BURITICÁ GOLD

Project & Construction Management services provided by Merit Consultants International 2017—2020

Production, set for 2020, will begin at 2,100 tpd and then increase by the 3rd year to 3,000tpd. Crushed and ground ore will go through gravity concentration, cyanide leaching and counter-current decantation, and the gold and silver will then be removed from the solution using the Merrill-Crowe process before being refined into doré bars. Continental Gold Inc. engaged M3 Engineering to handle engineering and procurement and Merit Consultants to provide construction management services.

***Under the direction of Continental's project director Donald Gray, Merit is providing pre-construction planning and on-site Construction Management services for the development of CNL's 2,100 tpd underground mine.***
